- LENGTH : 175mm / WEIGHT : 2.8oz

F E A T U R E

NEW SOFT SHELL

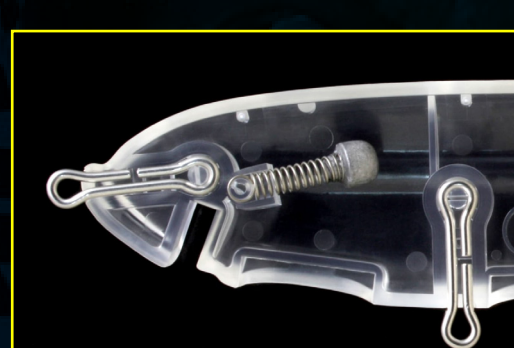

It produces stable action that does not upset the balance even in fast retrieve, and also plays a role of further improving the sharpness at the time of dirt.

In addition, hook entanglement with the body and lines, which tends to occur when casting or landing on water, is greatly reduced. It gives you a big advantage in big bait games where miscasting is fatal.

ABS CORE BODY

The ABS hollow core body, which shows a sharper and sharper dirt action, allows you to set a clear color and install a spring weight micro vibe system.

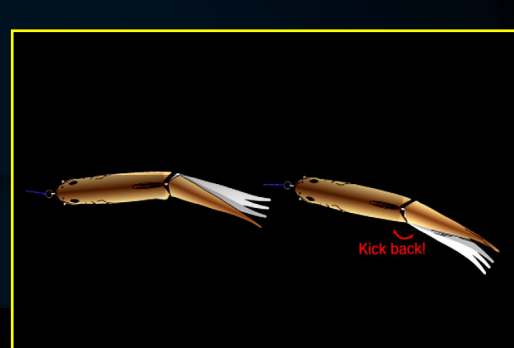

SPRING WEIGHT MICRO VIBE SYSTEM

The spring weight system mounted on the head part creates a slight vibration with a sense of life by shaking the weight, and induces a bite with a knock sound that hits the inner wall at the time of jerk.

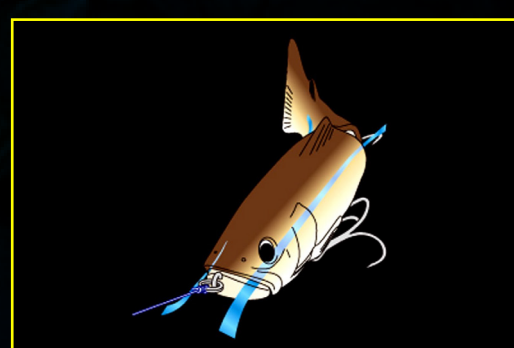

INSERT PLATE model/RATTLE

The insert plate built into the ABS core body is a model that appeals with a vivid reflection that shines dully through the shell.

JOINT ACTION

The damper effect of the soft shell that overhangs the front core body not only suppresses the noise generated by the collision of the joints, but also creates a lively wave by the secondary action generated by elastically pushing the rear body back.

WATER THROUGH DUCT

The duct provided between the core body and the soft shell takes in the water flow inside the body at the time of retrieval and discharges it at the joint part. The soft shell with a slight deflection creates a unique sense of life.
