Megabass VALKYRIE TECHNOLOGY

**SHIELZ**

Did you know that traditional kimono sashes from ancient times are made using excellent weaving techniques that are very rational in terms of strength calculations? Megabass Rod Factory analyzes the structure and feeds it back to rod technology. The crushing strength of the shaft is remarkably increased, and it is not only strong with high rigidity against bending and torsion, but also realizes ultra-long-term durability of the shaft even in the harsh environment with amazing lightness.

40% strong high elongation microglass fiber and 60%ultralight carbon graphite fiber are used to create a hybrid thin film fiber layer, which is finished in twill weave.

**MAHS**

[Variable handle length system] MAHS (Mars) can be adjusted to the optimum rod balance by adjusting the end handle length arbitrarily according to the reel's own weight. In addition, you can instantly change the rear handle length according to the approach, such as "Long" for long distance casting, "Short" for shooting in heavy cover.

"Long" for torqueful fights with big fish that require lifting power.  
"Short" when bringing a monster to a narrow scaffold or boat and bringing it to the landing.  
It is a Megabass unique system that dramatically improves the handling of long rods by making it variable.

\*If the setting exceeds the maximum or minimum of the scale, the grip may not stop or may cause damage. please note.
