FEATURES

Synonymous with performance, the redesigned line of Zodias rods incorporate Carbon Monocoque technology passed down from Shimano's elite series of rods that set the industry standard for sensitivity. Zodias rods couple a hollow Carbon Monocoque Grip into a CI4+ reel seat to achieve up to 30% more sensitivity than conventionally constructed models, ultimately transmitting vibration from underwater structure, lure action or bites to the palm of an angler's hand.

Shimano's Hi-Power X technology lies at the heart of Zodias rods and benefits anglers by increasing the transfer of energy through the rod for enhanced accuracy and casting distance as well as reduced blank twist for better control when fighting fish.

Carbon Monocoque Grip

Carbon Monocoque grip is a carbon-molded grip that is lightweight with high sensitivity, transferring even the smallest vibration to an angler's hand. The Carbon Monocoque Grip increases sensitivity by 30% compared to traditional rod handles and utilizes a hollow structure that eliminates unnecessary parts of the rear grip to improve weight reduction and vibration transmission.

Hi-Power X

Hi-Power X construction uses diagonally-wrapped carbon tape to form an array of "X" shapes on the rod blank's outermost layer. The width of the tape, its winding angle and the part of the rod being wrapped are fine-tuned according to the target fish species. This manufacturing process allows Shimano to adjust these wraps during construction for precise actions, enhanced overall strength and added twist resistance. In short, Hi-Power X construction delivers sharp and crisp rod control for the angler.

CI4+ Reel Seat

CI4 is a Shimano original material reinforced with carbon fiber that is lighter and has a higher strength than conventional resin material. CI4+ is an advanced version of the original CI4 material and is 2.5x more rigid than its predecessor. The use of CI4+ for the reel seat increases sensitivity and reduces weight while also delivering remarkable rigidity for perfect reel fixation and better rod efficiency.
