FEATURES

Multi-piece offshore rod compatible with aircraft loading restrictions.

Because SALTIGA AIRPORTABLE is a multi-piece expedition model, we paid particular attention not only to the beauty of the bending curve, but also to ensuring strength.

The blank material is HVF Nano Plus, which has high strength and strong tenacity, and by wrapping X45 from the tip of the outermost layer of the blank to the butt as reinforcement, it achieves high torsional rigidity.

The joint part achieves the same strength as a 1-piece rod by combining Daiwa's most advanced joint structure, V-joint α .

A multi-piece offshore rod that can be used safely even on expeditions has been completed.

DAIWA TECHNOLOGY

X45

X45

The installation of X45 prevents twisting and dramatically improves power, operability, and sensitivity.

V-JOINT α

V-JOINT α

By using nanoalloy, a high-strength material, in the joint part, we have evolved the V-JOINT to be even stronger, lighter, and more beautifully curved. When fishing with repeated casts, thinning the joint makes the entire blank thinner, improving swingability and operational feel.

HVF

nanoplus

HVF NANOPLUS

"High-density HVF carbon", which reduces the amount of resin and increases the density of carbon fiber, is the ideal material for rods that emphasize stickiness and strength, making it possible to further increase strength and reduce weight.

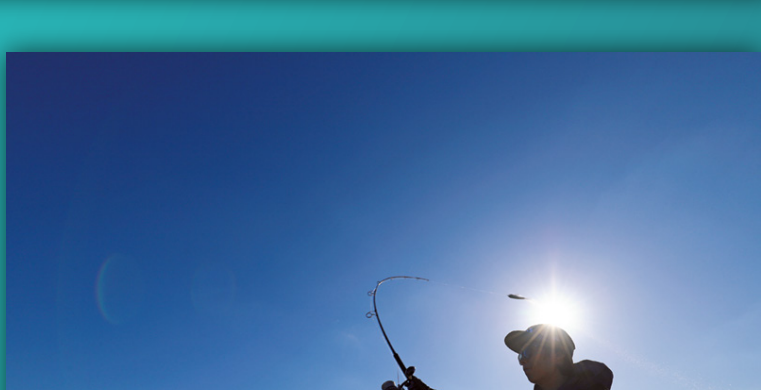

■DPS sheet

Dark blue and gold coloring enhances the sense of unity with SALTIGA reel

■Guide

Adopts MNSG guide to take advantage of strength
